Here's that turned into **legible Oobee product/development notes** without changing the idea:

Player Prop → Interactive Player Stats

When Oobee offers a **player prop on a slate**, users should be able to click directly on that specific prop to see the data behind the pick.

User flow:
Slate → Player Prop → Click Prop → Player Stats Page → Automatically Generated Prop Graph

For example, if Oobee offers:

Bijan Robinson — Over/Under 83 Rushing Yards

Clicking that prop should automatically take the user to Bijan Robinson's stats page and generate a graph specifically for **rushing yards compared with the 83-yard line**.

Graph layout:

- **Y-axis:** Player's statistical result — in this example, rushing yards.
- **X-axis:** Games played during the current season.
- Each game should be labeled with the **opponent and date**.
- A **horizontal line at 83 yards** should run across the graph, representing the betting line.
- There should be **one bar for every game played** that season.
- If Bijan records **more than 83 yards**, that game's bar is **green**.
- If Bijan records **fewer than 83 yards**, that game's bar is **red**.

Example:

Game 1 — 85 rushing yards → **Green**
Game 2 — 45 rushing yards → **Red**
Game 3 — 91 rushing yards → **Green**
…and so on for all 14 games.

Purpose

The goal is to make every Oobee player prop **immediately verifiable and visually understandable**. Instead of users having to leave Oobee and research the player's game log themselves, clicking the pick instantly shows them **how often that player has gone over or under the exact line Oobee is recommending**.

Eventually, the graph could also display a simple summary above it such as:

Over 83.0: 9/14 Games (64.3%)
Under 83.0: 5/14 Games (35.7%)
Season Average: 87.4 Yards

On the top you can have that players season average for all of said stats. Instead of whatever the fuck chat put. But for the most part the bottom part of the image is ideal and the same format we want for the most part. COLORS GREEN adn red are important,when people see green they splurge

AH SLOP but you get the idea, keep the oobee image, and like this prompt

Player Stats & Prop Visualization System

Oobee should have a dedicated **Stats Page** that houses the player-performance graphs described above.

The Stats Page serves **two purposes**:

1. Researching a Player Manually

Users can go directly to the Stats Page and search for any player.

After selecting a player, they can choose any available player-prop statistic, such as:

- Rushing yards
- Receiving yards
- Passing yards
- Receptions
- Touchdowns
- Strikeouts
- Hits
- RBIs
- Home runs
- Assists, shots, etc., depending on the sport

Once a statistic is selected, Oobee displays the player's **game-by-game performance for the current season against the sportsbook's posted line**.

For example:

Lionel Messi → Goals → Sportsbook Line: 1.0

Oobee would show Messi's entire season on a bar graph, with the **1.0 line running horizontally across the graph**. Games above the line are green and games below the line are red.

The user could then switch from **Goals → Shots → Assists**, and the graph and sportsbook line would automatically update.

2. Accessing the Same System Through an Oobee Pick

The player props offered on an Oobee slate connect directly to this Stats Page.

If Oobee offers:

Bijan Robinson — Over 83.0 Rushing Yards

Clicking that pick takes the user directly to:

Bijan Robinson → Stats Page → Rushing Yards → 83.0 Line

Everything is already selected for them.

Overall Idea

These are **not two separate features**.

The **Stats Page is the main player-research system**, while Oobee's player-prop picks provide a direct shortcut into the relevant part of that system.

Manual route:
Stats Page → Search Player → Select Stat → View Graph vs. Sportsbook Line

Oobee Pick route:
Slate → Click Player Prop → Automatically Open Same Stats Page + Correct Player + Correct Stat + Correct Lin
